## PLASMA PROTEASE C1 BIOPOLYMER MARKERS PREDICTIVE OF ALZHEIMERS DISEASE

2

4

1

## FIELD OF THE INVENTION

- This invention relates to the field of characterizing 5 the existence of a disease state; particularly to the 6 utilization of mass spectrometry to elucidate particular 7 biopolymer markers indicative or predictive of a particular 8 disease state, and most particularly to specific biopolymer 9 10 markers whose up-regulation, down-regulation, or relative presence in disease vs. normal states has been determined to 11 be useful in disease state assessment and therapeutic target 12 recognition, development and validation. 13
- 14 BACKGROUND OF THE INVENTION
- Methods utilizing mass spectrometry for the analysis of a target polypeptide have been taught wherein the polypeptide is first solubilized in an appropriate solution or reagent system. The type of solution or reagent system, e.g.,
- 19 comprising an organic or inorganic solvent, will depend on
- 20 the properties of the polypeptide and the type of mass
- 21 spectrometry performed and are well-known in the art (see,
- 22 e.g., Vorm et al. (1994) Anal. Chem. 66:3281 (for MALDI) and
- 23 Valaskovic et al. (1995) Anal. Chem. 67:3802 (for ESI). Mass
- 24 spectrometry of peptides is further disclosed, e.g., in WO

- 1 93/24834 by Chait et al.
- 2 In one prior art embodiment, the solvent is chosen so
- 3 that the risk that the molecules may be decomposed by the
- 4 energy introduced for the vaporization process is
- 5 considerably reduced, or even fully excluded. This can be
- 6 achieved by embedding the sample in a matrix, which can be an
- organic compound, e.g., sugar, in particular pentose or
- 8 hexose, but also polysaccharides such as cellulose. These
- 9 compounds are decomposed thermolytically into  ${\rm CO_2}$  and  ${\rm H_2O}$  so
- 10 that no residues are formed which might lead to chemical
- 11 reactions. The matrix can also be an inorganic compound,
- 12 e.g., nitrate of ammonium which is decomposed practically
- 13 without leaving any residues. Use of these and other solvents
- are further disclosed in U.S. Pat. No. 5,062,935 by Schlag et
- 15 al.
- 16 Prior art mass spectrometer formats for use in analyzing
- 17 the translation products include ionization (I) techniques,
- 18 including but not limited to matrix assisted laser desorption
- 19 (MALDI), continuous or pulsed electrospray (ESI) and related
- 20 methods (e.g., IONSPRAY or THERMOSPRAY), or massive cluster
- 21 impact (MCI); these ion sources can be matched with detection
- 22 formats including linear or non-linear reflection time-of-
- 23 flight (TOF), single or multiple quadropole, single or

- 1 multiple magnetic sector, Fourier Transform ion cyclotron
- 2 resonance (FTICR), ion trap, and combinations thereof (e.g.,
- ion-trap/time-of-flight). For ionization, numerous
- 4 matrix/wavelength combinations (MALDI) or solvent
- 5 combinations (ESI) can be employed. Subattomole levels of
- 6 protein have been detected, for example, using ESI
- 7 (Valaskovic, G. A. et al., (1996) Science 273:1199-1202) or
- 8 MALDI (Li, L. et al., (1996) J. Am. Chem. Soc. 118:1662-1663)
- 9 mass spectrometry.
- = 10 ES mass spectrometry has been introduced by Fenn et al.
  - 11 (J. Phys. Chem. 88, 4451-59 (1984); PCT Application No. WO
  - 12 90/14148) and current applications are summarized in recent
  - 13 review articles (R. D. Smith et al., Anal. Chem. 62, 882-89
  - 14 (1990) and B. Ardrey, Electrospray Mass Spectrometry,
  - 15 Spectroscopy Europe, 4, 10-18 (1992)). MALDI-TOF mass
  - spectrometry has been introduced by Hillenkamp et al.
  - 17 ("Matrix Assisted UV-Laser Desorption/Ionization: A New
  - 18 Approach to Mass Spectrometry of Large Biomolecules,"
  - 19 Biological Mass Spectrometry (Burlingame and McCloskey,
  - editors), Elsevier Science Publishers, Amsterdam, pp. 49-60,
  - 21 1990). With ESI, the determination of molecular weights in
  - 22 femtomole amounts of sample is very accurate due to the
  - 23 presence of multiple ion peaks which all could be used for

- 1 the mass calculation.
- The mass of the target polypeptide determined by mass
- 3 spectrometry is then compared to the mass of a reference
- 4 polypeptide of known identity. In one embodiment, the target
- 5 polypeptide is a polypeptide containing a number of repeated
- 6 amino acids directly correlated to the number of
- 7 trinucleotide repeats transcribed/translated from DNA; from
- 8 its mass alone the number of repeated trinucleotide repeats
- 9 in the original DNA which coded it, may be deduced.
- U.S. Patent No. 6,020,208 utilizes a general category of
  - 11 probe elements (i.e., sample presenting means) with Surfaces
  - 12 Enhanced for Laser Desorption/Ionization (SELDI), within
  - which there are three (3) separate subcategories. The SELDI
  - process is directed toward a sample presenting means (i.e.,
  - probe element surface) with surface-associated (or surface-
  - 16 bound) molecules to promote the attachment (tethering or
  - 17 anchoring) and subsequent detachment of tethered analyte
  - 18 molecules in a light-dependent manner, wherein the said
  - 19 surface molecule(s) are selected from the group consisting of
  - 20 photoactive (photolabile) molecules that participate in the
  - 21 binding (docking, tethering, or crosslinking) of the analyte
  - 22 molecules to the sample presenting means (by covalent
  - 23 attachment mechanisms or otherwise).

1 PCT/EP/04396 teaches a process for determining the 2 status of an organism by peptide measurement. The reference 3 teaches the measurement of peptides in a sample of the organism which contains both high and low molecular weight peptides and acts as an indicator of the organism's status. 5 6 The reference concentrates on the measurement of low molecular weight peptides, i.e. below 30,000 Daltons, whose 8 distribution serves as a representative cross-section of 9 defined controls. Contrary to the methodology of the instant 10 invention, the '396 patent strives to determine the status of 11 a healthy organism, i.e. a "normal" and then use this as a 12 reference to differentiate disease states. The present 13 inventors do not attempt to develop a reference "normal", but rather strive to specify particular markers whose presence, 14 15 absence or relative strength/concentration in disease vs. 16 normal is diagnostic of at least one specific disease state 17 or whose up-regulation or down-regulation is predictive of at 18 least one specific disease state, whereby the presence of 19 said marker serves as a positive indicator useful in 20 distinguishing disease state. This leads to a simple method 21 of analysis which can easily be performed by an untrained 22 individual, since there is a positive correlation of data. 23 On the contrary, the '396 patent requires a complicated

- 1 analysis by a highly trained individual to determine disease
- 2 state versus the perception of non-disease or normal
- 3 physiology.
- 4 Richter et al, Journal of Chromatography B, 726(1999)
- 5 25-35, refer to a database established from human
- 6 hemofiltrate comprised of a mass database and a sequence
- database. The goal of Richter et al was to analyze the
- 8 composition of the peptide fraction in human blood. Using
- 9 MALDI-TOF, over 20,000 molecular masses were detected
- 10 representing an estimated 5,000 different peptides. The
- 11 conclusion of the study was that the hemofiltrate (HF)
- 12 represented the peptide composition of plasma. No
- 13 correlation of peptides with relation to normal and/or
- 14 disease states is made.
- As used herein, "analyte" refers to any atom and/or
- 16 molecule; including their complexes and fragment ions. The
- 17 term may refer to a single component or a set of components.
- 18 In the case of biological molecules/macromolecules or
- 19 "biopolymers", such analytes include but are not limited to:
- 20 polypeptides, polynucleotides, proteins, peptides,
- 21 antibodies, DNA, RNA, carbohydrates, steroids, and lipids,
- and any detectable moiety thereof, e.g. immunologically
- 23 detectable fragments. Note that most important biomolecules

- 1 under investigation for their involvement in the structure or
- 2 regulation of life processes are quite large (typically
- 3 several thousand times larger than  $H_2O$ ).
- 4 As used herein, the term "molecular ions" refers to
- 5 molecules in the charged or ionized state, typically by the
- 6 addition or loss of one or more protons  $(H^+)$ .
- As used herein, the term "molecular fragmentation" or
- 8 "fragment ions" refers to breakdown products of analyte
- 9 molecules caused, for example, during laser-induced
- desorption (especially in the absence of added matrix).
- As used herein, the term "solid phase" refers to the
- 12 condition of being in the solid state, for example, on the
- 13 probe element surface.
- As used herein, "gas" or "vapor phase" refers to
- 15 molecules in the gaseous state (i.e., in vacuo for mass
- spectrometry).
- 17 As used herein, the term "analyte desorption/ionization"
- 18 refers to the transition of analytes from the solid phase to
- 19 the gas phase as ions. Note that the successful
- desorption/ionization of large, intact molecular ions by
- 21 laser desorption is relatively recent (circa 1988) -- the big
- 22 breakthrough was the chance discovery of an appropriate
- 23 matrix (nicotinic acid).

11

12

13

14

16

17

18

19

20

21

22

23

1 As used herein, the term "gas phase molecular ions" 2 refers to those ions that enter into the gas phase. Note that 3 large molecular mass ions such as proteins (typical 4 mass=60,000 to 70,000 times the mass of a single proton) are 5 typically not volatile (i.e., they do not normally enter into the gas or vapor phase). However, in the procedure of the 6 present invention, large molecular mass ions such as proteins 7

8 do enter the gas or vapor phase.

As used herein in the case of MALDI, the term "matrix" refers to any one of several small, acidic, light absorbing chemicals (e.g., CHCA (alpha-cyano-4-hydroxy-cinnamic acid), nicotinic or sinapinic acid) that is mixed in solution with the analyte in such a manner so that, upon drying on the probe element, the crystalline matrix-embedded analyte molecules are successfully desorbed (by laser irradiation) and ionized from the solid phase (crystals) into the gaseous or vapor phase and accelerated as intact molecular ions. For the MALDI process to be successful, analyte is mixed with a freshly prepared solution of the chemical matrix (e.g., 10,000:1 matrix:analyte) and placed on the inert probe element surface to air dry just before the mass spectrometric analysis. The large fold molar excess of matrix, present at concentrations near saturation, facilitates crystal formation 1 and entrapment of analyte.

2 As used herein, "energy absorbing molecules (EAM)" 3 refers to any one of several small, light absorbing chemicals that, when presented on the surface of a probe, facilitate 5 the neat desorption of molecules from the solid phase (i.e., surface) into the gaseous or vapor phase for subsequent 6 7 acceleration as intact molecular ions. The term EAM is preferred, especially in reference to SELDI. Note that 8 9 analyte desorption by the SELDI process is defined as a 10 surface-dependent process (i.e., neat analyte may be placed 11 on a surface composed of bound EAM or EAM and analyte may be 12 mixed prior to placement on a surface). In contrast, MALDI is 13 presently thought to facilitate analyte desorption by a 14 volcanic eruption-type process that "throws" the entire 15 surface into the gas phase. Furthermore, note that some EAM when used as free chemicals to embed analyte molecules as 16 described for the MALDI process will not work (i.e., they do 17 18 not promote molecular desorption, thus they are not suitable 19 matrix molecules).

As used herein, "probe element" or "sample presenting

device" refers to an element having the following properties:

it is inert (for example, typically stainless steel) and

active (probe elements with surfaces enhanced to contain EAM

- 1 and/or molecular capture devices).
- 2 As used herein, "MALDI" refers to Matrix-Assisted Laser
- 3 Desorption/Ionization.
- 4 As used herein, "TOF" stands for Time-of-Flight.
- 5 As used herein, "MS" refers to Mass Spectrometry.
- 6 As used herein, "MS/MS" refers to multiple sequential
- 7 mass spectrometry.
- 8 As used herein "MALDI-TOF MS" refers to Matrix-assisted
- 9 laser desorption/ionization time-of-flight mass spectrometry.
- 10 As used herein, "ESI" is an abbreviation for
- 11 electrospray ionization.
- 12 As used herein, "chemical bonds" is used simply as an
- 13 attempt to distinguish a rational, deliberate, and
- knowledgeable manipulation of known classes of chemical
- interactions from the poorly defined kind of general
- adherence observed when one chemical substance (e.g., matrix)
- is placed on another substance (e.g., an inert probe element
- 18 surface). Types of defined chemical bonds include
- 19 electrostatic or ionic (+/-) bonds (e.g., between a
- 20 positively and negatively charged groups on a protein
- 21 surface), covalent bonds (very strong or "permanent" bonds
- 22 resulting from true electron sharing), coordinate covalent
- bonds (e.g., between electron donor groups in proteins and

- 1 transition metal ions such as copper or iron), and
- 2 hydrophobic interactions (such as between two noncharged
- groups), weak dipole and London force or induced dipole
- 4 interactions.
- 5 As used herein, "electron donor groups" refers to the
- 6 case of biochemistry, where atoms in biomolecules (e.g., N, S,
- 7 O) "donate" or share electrons with electron poor groups
- 8 (e.g., Cu ions and other transition metal ions).
- 9 As used herein, the term "biopolymer markers indicative
- or predictive of a disease state" is interpreted to mean that
- a biopolymer marker which is strongly present in a normal
- 12 individual, but is down-regulated in disease is predictive of
- said disease; while alternatively, a biopolymer marker which
- is strongly present in a disease state, but is down-regulated
- in normal individuals, is indicative of said disease state.
- 16 Biopolymer markers which are present in both disease and
- 17 normal states are indicative/predictive based upon their
- 18 relative strengths in disease vs. normal, along with the
- 19 observation regarding when their signal strengthens/weakens
- 20 relative to disease manifestation or progression.
- 21 As used herein, the term "disease state assessment" is
- 22 interpreted to mean quantitative or qualitative determination
- of the presence/absence of the disease, with or without an

- 1 ability to determine severity, rapidity of onset, or
- 2 resolution of the disease state, e.g. a return to a normal
- 3 physiological state.
- 4 As used herein, the term "therapeutic target
- 5 recognition, development, and validation" refers to any
- 6 concept or method which enables an artisan to recognize,
- develop, or validate the efficacy of a therapeutic moiety
- 8 which is effected in conjunction with a chemical or physical
- 9 interaction with one or more of the biopolymer markers of the
- 10 instant invention.
- 11 As used herein, the term "polypeptide" is interpreted to
- 12 mean a polymer composed of amino acid residues, related
- 13 naturally occurring structural variants, and synthetic non-
- 14 naturally occurring analogs thereof linked via peptide bonds,
- 15 related naturally occurring structural variants, and
- synthetic non-naturally occurring analogs thereof. Synthetic
- 17 polypeptides can be synthesized, for example, using an
- 18 automated polypeptide synthesizer. The term "protein"
- 19 typically refers to large polypeptides. The term "peptide"
- 20 typically refers to short polypeptides. "Polypeptide(s)"
- 21 refers to any peptide or protein comprising two or more amino
- 22 acids joined to each other by peptide bonds or modified
- peptide bonds. "Polypeptide(s)" refers to both short chains,

- 1 commonly referred to as peptides, oligopeptides and oligomers
- 2 and to longer chains generally referred to as proteins.
- 3 Polypeptides may contain amino acids other than the 20 gene
- 4 encoded amino acids. "Polypeptide(s)" include those modified
- 5 either by natural processes, such as processing and other
- 6 post-translational modifications, but also by chemical
- 7 modification techniques. Such modifications are well
- 8 described in basic texts and in more detailed monographs, as
- 9 well as in a voluminous research literature, and they are
- 10 well-known to those of skill in the art. It will be
- 11 appreciated that the same type of modification may be present
- in the same or varying degree at several sites in a given
- polypeptide. Also, a given polypeptide may contain many types
- 14 of modifications. Modifications can occur anywhere in a
- polypeptide, including the peptide backbone, the amino acid
- side-chains, and the amino or carboxyl termini. Modifications
- include, for example, acetylation, acylation, ADP-
- 18 ribosylation, amidation, covalent attachment of flavin,
- 19 covalent attachment of a heme moiety, covalent attachment of
- 20 a nucleotide or nucleotide derivative, covalent attachment of
- 21 a lipid or lipid derivative, covalent attachment of
- 22 phosphotidylinositol, cross-linking, cyclization, disulfide
- 23 bond formation, demethylation, formation of covalent cross-

- 1 links, formation of cysteine, formation of pyroglutamate,
- formylation, gamma-carboxylation, glycosylation, GPI anchor
- formation, hydroxylation, iodination, methylation,
- 4 myristoylation, oxidation, proteolytic processing,
- 5 phosphorylation, prenylation, racemization, glycosylation,
- 6 lipid attachment, sulfation, gamma-carboxylation of glutamic
- 7 acid residues, hydroxylation and ADP-ribosylation,
- 8 selenoylation, sulfation, transfer-RNA mediated addition of
- 9 amino acids to proteins, such as arginylation, and
- 10 ubiquitination. See, for instance, PROTEINS--STRUCTURE AND
- MOLECULAR PROPERTIES, 2nd Ed., T. E. Creighton, W. H. Freeman
- 12 and Company, New York (1993) and Wold, F., Posttranslational
- Protein Modifications: Perspectives and Prospects, pgs. 1-12
- in POSTTRANSLATIONAL COVALENT MODIFICATION OF PROTEINS, B. C.
- Johnson, Ed., Academic Press, New York (1983); Seifter et
- 16 al., Meth. Enzymol. 182:626-646 (1990) and Rattan et al.,
- 17 Protein Synthesis: Posttranslational Modifications and Aging,
- 18 Ann. N.Y. Acad. Sci. 663: 48-62 (1992). Polypeptides may be
- 19 branched or cyclic, with or without branching. Cyclic,
- 20 branched and branched circular polypeptides may result from
- 21 post-translational natural processes and may be made by
- 22 entirely synthetic methods, as well.
- 23 As used herein, the term "polynucleotide" is interpreted

- 1 to mean a polymer composed of nucleotide units.
- 2 Polynucleotides include naturally occurring nucleic acids,
- 3 such as deoxyribonucleic acid ("DNA") and ribonucleic acid
- 4 ("RNA") as well as nucleic acid analogs. Nucleic acid analogs
- 5 include those which include non-naturally occurring bases,
- 6 nucleotides that engage in linkages with other nucleotides
- 7 other than the naturally occurring phosphodiester bond or
- 8 which include bases attached through linkages other than
- 9 phosphodiester bonds. Thus, nucleotide analogs include, for
- $\bigcirc$  10 example and without limitation, phosphorothicates,
  - 11 phosphorodithioates, phosphorotriesters,
  - 12 phosphoramidates, boranophosphates, methylphosphonates,
  - 13 chiral-methyl phosphonates, 2-0-methyl ribonucleotides,
  - 14 peptide-nucleic acids (PNAs), and the like. Such
  - 15 polynucleotides can be synthesized, for example, using an
  - 16 automated DNA synthesizer. The term "nucleic acid" typically
  - 17 refers to large polynucleotides. The term "oligonucleotide"
  - 18 typically refers to short polynucleotides, generally no
  - 19 greater than about 50 nucleotides. It will be understood that
  - when a nucleotide sequence is represented by a DNA sequence
  - 21 (i.e., A, T, G, C), this also includes an RNA sequence (i.e.,
  - 22 A, U, G, C) in which "U" replaces T.
  - 23 As used herein, the term "detectable moiety" or a

- 1 "label" refers to a composition detectable by spectroscopic,
- 2 photochemical, biochemical, immunochemical, or chemical
- means. For example, useful labels include 32P, 35S,
- 4 fluorescent dyes, electron-dense reagents, enzymes (e.g., as
- 5 commonly used in an ELISA), biotin-streptavadin, dioxigenin,
- 6 haptens and proteins for which antisera or monoclonal
- 7 antibodies are available, or nucleic acid molecules with a
- 8 sequence complementary to a target. The detectable moiety
- 9 often generates a measurable signal, such as a radioactive,
- $\equiv$  10 chromogenic, or fluorescent signal, that can be used to
- - 12 The detectable moiety can be incorporated in or attached to a
  - primer or probe either covalently, or through ionic, van
  - der Waals or hydrogen bonds, e.g., incorporation of
  - 15 radioactive nucleotides, or biotinylated nucleotides that are
  - 16 recognized by streptavadin. The detectable moiety may be
  - 17 directly or indirectly detectable. Indirect detection can
  - involve the binding of a second directly or indirectly
  - detectable moiety to the detectable moiety. For example, the
  - 20 detectable moiety can be the ligand of a binding partner,
  - 21 such as biotin, which is a binding partner for streptavadin,
  - 22 or a nucleotide sequence, which is the binding partner for a
  - complementary sequence, to which it can specifically

- 1 hybridize. The binding partner may itself be directly
- detectable, for example, an antibody may be itself labeled
- 3 with a fluorescent molecule. The binding partner also may be
- 4 indirectly detectable, for example, a nucleic acid having a
- 5 complementary nucleotide sequence can be a part of a branched
- 6 DNA molecule that is in turn detectable through hybridization
- 7 with other labeled nucleic acid molecules. (See, e.g., P. D.
- 8 Fahrlander and A. Klausner, Bio/Technology (1988) 6:1165.)
- 9 Quantitation of the signal is achieved by, e.g.,
- scintillation counting, densitometry, or flow cytometry.
- 11 As used herein, the term "antibody or antibodies"
- 12 includes polyclonal and monoclonal antibodies of any isotype
- 13 (IgA, IgG, IgE, IgD, IgM), or an antigen-binding portion
- thereof, including but not limited to F(ab) and Fv fragments,
- single chain antibodies, chimeric antibodies, humanized
- 16 antibodies, and a Fab expression library. "Antibody" refers
- 17 to a polypeptide ligand substantially encoded by an
- immunoglobulin gene or immunoglobulin genes, or fragments
- 19 thereof, which specifically binds and recognizes an epitope
- 20 (e.g., an antigen). The recognized immunoglobulin --genes
- 21 include the kappa and lambda light chain constant region
- 22 genes, the alpha, gamma, delta, epsilon and mu heavy chain
- 23 constant region genes, and the myriad immunoglobulin variable

- 1 region genes. Antibodies exist, e.g., as intact
- 2 immunoglobulins or as a number of well characterized
- 3 fragments produced by digestion with various peptidases. This
- 4 includes, e.g., Fab' and F(ab)', fragments. The term
- 5 "antibody," as used herein, also includes antibody fragments
- 6 either produced by the modification of whole antibodies or
- 7 those synthesized de novo using recombinant DNA
- 8 methodologies. It also includes polyclonal antibodies,
- 9 monoclonal antibodies, chimeric antibodies and humanized
- 10 antibodies. "Fc" portion of an antibody refers to that
- 11 portion of an immunoglobulin heavy chain that comprises one
- or more heavy chain constant region domains,  $CH_2$  and  $CH_3$ ,
- 13 but does not include the heavy chain variable region.
- As used herein, the term "moieties" refers to an
- indefinite portion of a sample.
- A "ligand" is a compound that specifically binds to a
- 17 target molecule.
- 18 A "receptor" is a compound or portion of a structure
- 19 that specifically binds to a ligand.
- A ligand or a receptor (e.g., an antibody) "specifically
- 21 binds to" or "is specifically immunoreactive with" a compound
- 22 analyte when the ligand or receptor functions in a binding
- 23 reaction which is determinative of the presence of the

- 1 analyte in a sample of heterogeneous compounds. Thus, under
- designated assay (e.g., immunoassay) conditions, the ligand
- 3 or receptor binds preferentially to a particular analyte and
- 4 does not bind in a significant amount to other compounds
- 5 present in the sample. For example, a polynucleotide
- 6 specifically binds under hybridization conditions to an
- 7 analyte polynucleotide comprising a complementary sequence;
- 8 an antibody specifically binds under immunoassay conditions
- 9 to an antigen analyte bearing an epitope against which the
- 10 antibody was raised; and an adsorbent specifically binds to
- an analyte under proper elution conditions.
- 12 As used herein, the term "pharmaceutically effective
- 13 carrier" refers to any solid or liquid material which may be
- 14 used in creating formulations that further include active
- ingredients of the instant invention, e.g. biopolymer markers
- or therapeutics, for administration to a patient.
- 17 As used herein, the term "agent" is interpreted to mean
- 18 a chemical compound, a mixture of chemical compounds, a
- sample of undetermined composition, a combinatorial small
- 20 molecule array, a biological macromolecule, a bacteriophage
- 21 peptide display library, a bacteriophage antibody (e.g.,
- 22 scFv) display library, a polysome peptide display library, or
- 23 an extract made from biological materials such as bacteria,

- 1 plants, fungi, or animal cells or tissues. Suitable
- 2 techniques involve selection of libraries of recombinant
- 3 antibodies in phage or similar vectors. See, Huse et al.
- 4 (1989) Science 246: 1275-1281; and Ward et al. (1989) Nature
- 5 341: 544-546. The protocol described by Huse is
- 6 rendered more efficient in combination with phage display
- 7 technology. See, e.g., Dower et al., WO 91/17271 and
- 8 McCafferty et al., WO 92/01047.
- 9 As used herein, the term "isolated" is interpreted to
- 10 mean altered "by the hand of man" from its natural state,
- i.e., if it occurs in nature, it has been changed or removed
- 12 from its original environment, or both. For example, a
- 13 polynucleotide or a polypeptide naturally present in a living
- organism is not "isolated," but the same polynucleotide or
- polypeptide separated from the coexisting materials of its
- natural state is "isolated", as the term is employed herein.
- 17 As used herein, the term "variant" is interpreted to
- 18 mean a polynucleotide or polypeptide that differs from a
- 19 reference polynucleotide or polypeptide respectively, but
- 20 retains essential properties. A typical variant of a
- 21 polynucleotide differs in nucleotide sequence from another,
- 22 reference polynucleotide. Changes in the nucleotide sequence
- of the variant may or may not alter the amino acid sequence

- of a polypeptide encoded by the reference polynucleotide.
- 2 Nucleotide changes may result in amino acid substitutions,
- 3 additions, deletions, fusions and truncations in the
- 4 polypeptide encoded by the reference sequence, as discussed
- 5 below. A typical variant of a polypeptide differs in amino
- 6 acid sequence from another, reference polypeptide. Generally,
- 7 differences are limited so that the sequences of the
- 8 reference polypeptide and the variant are closely similar
- 9 overall and, in many regions, identical. A variant and
- 10 reference polypeptide may differ in amino acid sequence by
- 11 one or more substitutions, additions, deletions in any
- 12 combination. A substituted or inserted amino acid residue may
- or may not be one encoded by the genetic code. A variant of a
- polynucleotide or polypeptide may be a naturally occurring
- 15 such as an allelic variant, or it may be a variant that is
- 16 not known to occur naturally. Non-naturally occurring
- variants of polynucleotides and polypeptides may be made by
- 18 mutagenesis techniques, by direct synthesis, and by other
- 19 recombinant methods known to skilled artisans.
- 20 As used herein, the term "biopolymer marker" refers to a
- 21 polymer of biological origin, e.g. polypeptides,
- 22 polynucleotides, polysaccharides or polyglycerides (e.g., di-
- or tri-glycerides), and may include any fragment, e.g.

- 1 immunologically reactive fragments, variants or moieties
- 2 thereof.
- 3 As used herein, the term "fragment" refers to the
- 4 products of the chemical, enzymatic, or physical breakdown of
- 5 an analyte. Fragments may be in a neutral or ionic state.
- 6 As used herein, the term "therapeutic avenues" is
- 7 interpreted to mean any agents, modalities, synthesized
- 8 compounds, etc., which interact with a biopolymer marker in
- 9 any manner that facilitates a therapeutic benefit, including
- immunotherapeutic intervention, e.g. modalities such as
- 11 administration of an immunologically reactive moiety capable
- of altering the course, progression and/or manifestation of
- 13 the disease, as a result of interfering with the disease
- 14 manifestation process, for example, at the early stages
- focused upon by the identification of the disease, such as by
- supplying a moiety capable of modifying the pathogenicity of
- 17 lymphocytes specific for the biopolymer marker or related
- 18 components.
- 19 As used herein, the term "interacting with a biopolymer
- 20 marker" includes any process by which a biopolymer marker may
- 21 physically or chemically relate with an organism,
- 22 particularly when this interaction results in the development
- 23 of therapeutic avenues or in modulation of the disease state.

As used herein, the term "therapeutic targets" may thus 1 2 be defined as those analytes which are capable of exerting a 3 modulating force, wherein "modulation" is defined as an alteration in function inclusive of activity, synthesis, 4 5 production, and circulating levels. Thus, modulation effects 6 the level or physiological activity of at least one particular disease related biopolymer marker or any compound 7 or biomolecule whose presence, level or activity is linked 8 9 either directly or indirectly, to an alteration of the **1**0 presence, level, activity or generic function of the 11 biopolymer marker, and may include pharmaceutical agents, 12 biomolecules that bind to the biopolymer markers, or 13 biomolecules or complexes to which the biopolymer markers The binding of the biopolymer markers and the 14 therapeutic moiety may result in activation (agonist), 16 inhibition (antagonist), or an increase or decrease in activity or production (modulator) of the biopolymer markers 17 or the bound moiety. Examples of such therapeutic moieties 18 19 include, but are not limited to, antibodies, 20 oligonucleotides, proteins (e.g., receptors), RNA, DNA, 21 enzymes, peptides or small molecules. With regard to 22 immunotherapeutic moieties, such a moiety may be defined as

an effective analog for a major epitope peptide which has the

- 1 ability to reduce the pathogenicity of key lymphocytes which
- 2 are specific for the native epitope. An analog is defined as
- 3 having structural similarity but not identity in peptide
- 4 sequencing able to be recognized by T-cells spontaneously
- 5 arising and targeting the endogeneous self epitope. A
- 6 critical function of this analog is an altered T-cell
- 7 activation which leads to T-cell anergy or death.
- 8 With the advent of mass spectrometric methods such as
- 9 MALDI and SELDI and ESI, researchers have begun to utilize a
- tool that holds the promise of uncovering countless
- 11 biopolymers which result from translation, transcription and
- 12 post-translational transcription of proteins from the entire
- 13 genome.
- Operating upon the principles of retentate
- chromatography, SELDI MS involves the adsorption of proteins,
- 16 based upon their physico-chemical properties at a given pH
- 17 and salt concentration, followed by selectively desorbing
- 18 proteins from the surface by varying pH, salt, or organic
- 19 solvent concentration. After selective desorption, the
- 20 proteins retained on the SELDI surface, the "chip", can be
- 21 analyzed using the CIPHERGEN protein detection system, or an
- 22 equivalent thereof. Retentate chromatography is limited,
- 23 however, by the fact that if unfractionated body fluids, e.g.

- 1 blood, blood products, urine, saliva, cerebrospinal fluid,
- 2 luymph and the like, along with tissue samples, are applied
- to the adsorbent surfaces, the biopolymers present in the 3
- greatest abundance will compete for all the available binding
- 5 sites and thereby prevent or preclude less abundant
- 6 biopolymers from interacting with them, thereby reducing or
- 7 eliminating the diversity of biopolymers which are readily
- 8 ascertainable.

ſ

9 If a process could be devised for maximizing the diversity of biopolymers discernable from a sample, the 11 ability of researchers to accurately determine the relevance 12 of such biopolymers with relation to one or more disease

13

## SUMMARY OF THE INVENTION

states would be immeasurably enhanced.

The instant invention is characterized by the use of a 17 combination of preparatory steps, e.g. chromatography and 1-D 18 tricine polyacrylamide gel electrophoresis. Subsequent to 19 which the gel is stained, e.g. with Coomasie blue, silver or 20 Next, bands are selected from the gels for further rubidium. 21 study. Tryptic digestion of each band follows, concluding 22 with the extraction of tryptic peptides from the digest.

23 This extraction may be accomplished utilizing C18 ZIPTIPs, or

- 1 organic extract and dry technique followed by MALDI Og TOF 2 (Maldi Quadrupole Quadrupole Time of Flight) processing. 3 Additional methodologies may include SELDI MS, 2-D gel 4 technology, MALDI MS/MS and time-of-flight detection 5 procedures to maximize the diversity of biopolymers which are verifiable within a particular sample. The cohort of 6 biopolymers verified within a sample is then compared to 7 8 develop data indicating their presence, absence or relative 9 strength/concentration in disease vs normal controls, and 10 further studied to determine whether the up-regulation or 11 down-regulation of a single biopolymer or group of 12 biopolymers is indicative of a disease state or predictive of 13 the development of said disease state. Additionally, 14 biopolymers recognized as being indicative or predictive of a 15 disease state in accordance with the instant invention are 16 useful in therapeutic intervention, e.g. as therapeutic 17 modalities in their own right, in the course of therapeutic target recognition, in the development and validation of 18 19 efficacious therapeutic modalities, e.g when interrogating or 20 developing phage display libraries, and as ligands or 21 receptors for use in conjunction with therapeutic 22 intervention.
- 23 Although all manner of biomarkers related to all disease

- 1 conditions are deemed to be within the purview of the instant
- 2 invention and methodology, particular significance was given
- 3 to those markers and diseases associated with the complement
- 4 system, cognitive diseases, e.g. Alzheimer's disease and
- 5 Syndrome X and diseases related thereto.
- 6 The complement system is an important part of non-clonal
- 7 or innate immunity that collaborates with acquired immunity
- 8 to destroy invading pathogens and to facilitate the clearance
- 9 of immune complexes from the system. This system is the
- 10 major effector of the humoral branch of the immune system,
- 11 consisting of nearly 30 serum and membrane proteins. The
- 12 proteins and glycoproteins composing the complement system
- 13 are synthesized largely by liver hepatocytes. Activation of
- 14 the complement system involves a sequential enzyme cascade in
- which the proenzyme product of one step becomes the enzyme
- 16 catalyst of the next step. Complement activation can occur
- 17 via two pathways: the classical and the alternative. The
- 18 classical pathway is commonly initiated by the formation of
- soluble antigen-antibody complexes or by the binding of
- antibody to antigen on a suitable target, such as a bacterial
- 21 cell. The alternative pathway is generally initiated by
- 22 various cell-surface constituents that are foreign to the
- 23 host. Each complement component is designated by numerals

11

12

13

- 1 (C1-C9), by letter symbols, or by trivial names. After a 2 component is activated, the peptide fragments are denoted by small letters. The complement fragments interact with one 3 another to form functional complexes. Ultimately, foreign 5 cells are destroyed through the process of a membrane-attack 6 complex mediated lysis. The C4 component of the complement system is involved in 8 the classical activation pathway. It is a glycoprotein
  - containing three polypeptide chains  $(\alpha, \beta, \text{ and } \gamma)$ . C4 is a substrate of component C1s and is activated when C1s hydrolyzes a small fragment (C4a) from the amino terminus of the  $\alpha$  chain, exposing a binding site on the larger fragment (C4b).

14 The native C3 component consists of two polypeptide 15 chains,  $\alpha$  and  $\beta$ . As a serum protein, C3 is involved in the 16 alternative pathway. Serum C3, which contains an unstable 17 thioester bond, is subject to slow spontaneous hydrolysis 18 into C3a and C3b. The C3f component is involved in the 19 regulation required of the complement system which confines 20 the reaction to designated targets. During the regulation 21 process, C3b is cleaved into two parts: C3bi and C3f. C3bi 22 is a membrane-bound intermediate wherein C3f is a free 23 diffusible (soluble) component.

1 Complement components have been implicated in the 2 pathogenesis of several disease conditions. C3 deficiencies 3 have the most severe clinical manifestations, such as recurrent bacterial infections and immune-complex diseases, reflecting the central role of C3. The rapid profusion of 6 C3f moieties and resultant "accidental" lysis of normal cells 7 mediated thereby gives rise to a host of auto-immune 8 The ability to understand and control these 9 mechanisms, along with their attendant consequences, will 10 enable practitioners to develop both diagnostic and 11 therapeutic avenues by which to thwart these maladies. 12 In the course of defining a plurality of disease 13 specific marker sequences, special significance was given to 14 markers which were evidentiary of a particular disease state 15 or with conditions associated with Syndrome-X. Syndrome-X is 16 a multifaceted syndrome, which occurs frequently in the 17 general population. A large segment of the adult population 18 of industrialized countries develops this metabolic syndrome, 19 produced by genetic, hormonal and lifestyle factors such as 20 obesity, physical inactivity and certain nutrient excesses. 21 This disease is characterized by the clustering of insulin 22 resistance and hyperinsulinemia, and is often associated with

dyslipidemia (atherogenic plasma lipid profile), essential

- 1 hypertension, abdominal (visceral) obesity, glucose
- 2 intolerance or noninsulin-dependent diabetes mellitus and an
- 3 increased risk of cardiovascular events. Abnormalities of
- 4 blood coagulation (higher plasminogen activator inhibitor
- 5 type I and fibrinogen levels), hyperuricemia and
- 6 microalbuminuria have also been found in metabolic syndrome-
- 7 X.
- 8 The instant inventors view the Syndrome X continuum in
- 9 its cardiovascular light, while acknowledging its important
- 10 metabolic component. The first stage of Syndrome X consists
- of insulin resistance, abnormal blood lipids (cholesterol,
- triglycerides and free fatty acids), obesity, and high blood
- 13 pressure (hypertension). Any one of these four first stage
- 14 conditions signals the start of Syndrome X.
- 15 Each first stage Syndrome X condition risks leading to
- 16 another. For example, increased insulin production is
- 17 associated with high blood fat levels, high blood pressure,
- 18 and obesity. Furthermore, the effects of the first stage
- 19 conditions are additive; an increase in the number of
- 20 conditions causes an increase in the risk of developing more
- 21 serious diseases on the Syndrome X continuum.
- 22 A patient who begins the Syndrome X continuum risks
- 23 spiraling into a maze of increasingly deadly diseases. The

- 1 next stages of the Syndrome X continuum lead to overt
- 2 diabetes, kidney failure, and heart failure, with the
- 3 possibility of stroke and heart attack at any time. Syndrome
- 4 X is a dangerous continuum, and preventative medicine is the
- 5 best defense. Diseases are currently most easily diagnosed
- 6 in their later stages, but controlling them at a late stage
- 7 is extremely difficult. Disease prevention is much more
- 8 effective at an earlier stage.
- 9 In a further contemplated embodiment of the invention,
- samples may be taken from a patient at one point in time, as
- 11 a single sample or as multiple samples, or at different
- 12 points in time such that analysis is carried out on multiple
- samples for ongoing analysis. Typically, a first sample is
- taken from a patient upon presentation with possible symptoms
- of a disease and analyzed according to the invention.
- 16 Subsequently, some period of time after presentation, for
- 17 example, about 3 6 months after the first presentation, a
- 18 second sample is taken and analyzed according to the
- 19 invention. The data can be used, by way of example, to
- 20 diagnose or monitor a disease state, determine risk
- 21 assessment, identify therapeutic avenues, or determine the
- 22 therapeutic value of an agent such as a pharmaceutical.
- 23 Subsequent to the isolation of particular disease state

- 1 marker sequences as taught by the instant invention, the
- 2 promulgation of various forms of risk assessment tests are
- 3 contemplated which will allow physicians to identify
- 4 asymptomatic patients before they suffer an irreversible
- 5 event such as diabetes, kidney failure, and heart failure,
- 6 and enable effective disease management and preventative
- 7 medicine. Additionally, the specific diagnostic tests which
- 8 evolve from this methodology provide a tool for rapidly and
- 9 accurately diagnosing acute Syndrome X events such as heart
- 10 attack and stroke, and facilitate treatment.
- 11 More particularly, biopolymer markers elucidated via
- methodologies of the instant invention find utility related
- 13 to broad areas of disease therapeutics. Such therapeutic
- 14 avenues include, but are not limited to:
- 15 1) utilization and recognition of said biopolymer
- 16 markers, variants or moieties thereof as direct therapeutic
- 17 modalities, either alone or in conjunction with an effective
- 18 amount of a pharmaceutically effective carrier;
- 19 2) validation of therapeutic modalities or disease
- 20 preventative agents as a function of biopolymer marker
- 21 presence or concentration;
- 22 3) treatment or prevention of a disease state by
- 23 formation of disease intervention modalities; e.g. formation

- of biopolymer/ligand conjugates which intervene at receptor
- 2 sites to prevent, delay or reverse a disease process;
- 3 4) use of biopolymer markers or moieties thereof as a
- 4 means of elucidating therapeutically viable agents, e.g. from
- 5 a bacteriophage peptide display library, a bacteriophage
- 6 antibody library or the like;
- 7 5) instigation of a therapeutic immunological
- 8 response; and
- 9 6) synthesis of molecular structures related to said
- 10 biopolymer markers, moieties or variants thereof which are
- 11 constructed and arranged to therapeutically intervene in the
- 12 disease process.
- 13 A process for identifying or developing therapeutic
- 14 avenues related to a disease state utilizing any of the above
- 15 examples may follow results obtained from conducting an
- 16 analysis inclusive of interacting with a biopolymer including
- 17 the sequence of the particular disease specific marker or at
- 18 least one analyte thereof of the present invention. Such
- 19 treatment or prevention of a disease state by formation of
- 20 disease intervention modalities may be by the formation of
- 21 biopolymer/ligand conjugates which intervene at receptor
- 22 sites to prevent, delay, or reverse a disease process. In
- 23 addition, a means of elucidating therapeutically viable

- 1 agents may include the use of a bacteriophage peptide display
- 2 library or a bacteriophage antibody library. The therapeutic
- avenues may regulate the presence or absence of the
- 4 biopolymer including the sequence of the particular disease
- 5 specific marker or at least one analyte thereof in the
- 6 present invention.
- Accordingly, it is an objective of the instant invention
- 8 to define a disease specific biopolymer marker sequence which
- 9 is useful in evidencing and categorizing at least one
- 10 particular disease state.
- It is an additional objective of the instant invention
- to develop methods and means of disease therapy, including
- 13 but not limited to:
- 14 1) utilization and recognition of said biopolymer
- 15 markers, variants or moieties thereof as direct therapeutic
- 16 modalities, either alone or in conjunction with an effective
- amount of a pharmaceutically effective carrier;
- 18 2) validation of therapeutic modalities or disease
- 19 preventative agents as a function of biopolymer marker
- 20 presence or concentration;
- 21 3) treatment or prevention of a disease state by
- formation of disease intervention modalities; e.g. formation
- of biopolymer/ligand conjugates which intervene at receptor

- 1 sites to prevent, delay or reverse a disease process;
- 2 4) use of biopolymer markers or moieties thereof as a
- 3 means of elucidating therapeutically viable agents, e.g. from
- 4 a bacteriophage peptide display library, a bacteriophage
- 5 antibody library or the like;
- 6 5) instigation of a therapeutic immunological
- 7 response; and
- 8 6) synthesis of molecular structures related to said
- 9 biopolymer markers, moieties or variants thereof which are
- $\equiv 10$  constructed and arranged to therapeutically intervene in the
  - 11 disease process, e.g. by directly determining the three-
  - dimensional structure of said biopolymer marker directly from
  - an amino acid sequence thereof.
  - It is another objective of the instant invention to
  - 15 evaluate samples containing a plurality of biopolymers for
  - the presence of disease specific biopolymer marker sequences
  - 17 (disease specific markers) which evidence a link to at least
  - 18 one specific disease state.
  - 19 It is a further objective of the instant invention to
  - 20 elucidate essentially all biopolymeric markers, moieties or
  - variants thereof contained within said samples, whereby
  - 22 particularly significant moieties may be identified.
  - It is a further objective of the instant invention

1 provide at least one purified antibody which is specific to

2 said disease specific marker sequence.

3 It is yet another objective of the instant invention to teach a monoclonal antibody which is specific to said disease 4 5 specific marker sequence.

It is a still further objective of the invention to teach polyclonal antibodies raised against said disease specific marker.

It is yet an additional objective of the instant invention to teach a diagnostic kit for determining the presence, concentration, or relative strength/concentration of said disease specific marker.

It is a still further objective of the instant invention to teach methods for characterizing disease state based upon the identification of said disease specific marker.

Other objects and advantages of this invention will become apparent from the following description taken in conjunction with the accompanying drawings wherein are set forth, by way of illustration and example, certain embodiments of this invention. The drawings constitute a part of this specification and include exemplary embodiments of the present invention and illustrate various objects and features thereof.

- 4 comparing Alzheimers disease versus Age Matched Control.

5

6

## DETAILED DESCRIPTION OF THE INVENTION

7 In earlier work, for example in U.S. Patent application

8 09/846330 filed April 30, 2000, the contents of which is

9 herein incorporated by reference, raw sera was obtained and

mixed with formic acid and extracted the peptides with C18

11 reversed phase ZIPTIPs.

In the instantly disclosed invention, we deal with proteins generally having a molecular weight of about 20 kD or more. In general, proteins of greater than 20 kD can reliably be fragmented by trypsin or other enzymes. The instant technology incorporates sufficient sensitivity to deal with even the low production of peptides from proteins

18 less than 20 kD clipped from gel.

Proteins differ from peptides in that they cannot be effectively resolved by time of flight MS and they are too large (>3kD) to be effectively fragmented by collision with gases. The most commonly used solution to these problems is to resolve the proteins by polyacrylamide gel electrophoresis

- 1 followed by staining with silver, or coomasie brilliant blue or rubidium dyes or counter staining with Zinc-SDS complexes. 2 Once the proteins have been resolved and visualized with 3 stains the proteins that differ between disease states can then be excised from the gel and the protein purified in the 5 1-D gel band or 2-D gel spot can be cleaved into fragments 6 7 less that 3 kD by proteolytic enzymes. Once protein has been 8 resolved by gel and cleaved by enzymes, the protein is considered in the form of peptides and therefore can be dealt 10 with as per earlier work (09/846330). The peptide is either 11 collected and purified with C18 reversed phase chromatography 12 or by some other form of chromatography prior to reversed 13 phase separation. The peptide can also be collected in 14 ammonium carbonate buffer that is subsequently evolved by 15 reaction with acid or by removal in organic solvents. 16 Once the peptides are collected they can be sequenced, 17 e.g. with a MALDI-Qg-TOF but also with a TOF-TOF, and 18 ESI-Q-TOF or an ION-TRAP. Other types of MS analysis which may be employed are SELDI MS and MS/MS. The peptides are
- may be employed are SELDI MS and MS/MS. The peptides are
  fragments of the original protein. The peptides are
  sequenced by fragmentation to produced a spectrum composed of

the parts of the peptide. The peptide fragments can be

23 produced by a strong ionization energy with a laser,

- 1 temperature, electron capture, collision between the peptides
- 2 themselves or with other objects such as gas molecules. The
- 3 spacing in terms of mass between the parts of the peptides is
- 4 a fragmentation pattern. The fragmentation pattern of each
- 5 peptide from the starting mass to the last remaining amino
- 6 acid (from either end) is unique.
- 7 The human genome contains the genes that encode all
- 8 proteins. The proteolytic cut sites within all these
- 9 proteins can be predicted from the translated amino acid
- $oxedsymbol{\square}$  10 sequence. The mass of the peptides that result from the
  - 11 predicting cut sites can be calculated. Similarly, the
  - 12 fragmentation pattern from each hypothetical peptide can be
  - 13 predicted. Thus, we can conceptually digest the proteins
  - 14 within the human proteome and fragment them.
  - When a peptide has been "sequenced" it is understood
  - that the peptide fragment has been purified by one of the
  - methods above, i.e. Time of flight (TOF) or by
  - 18 chromatography, before fragmenting it with gas to produce the
  - 19 peptide fragments. The original peptide mass and
  - 20 fragmentation pattern obtained is then fit to those from the
  - 21 theoretical digestion and fragmentation of the genome. The
  - 22 peptide that best matches the theoretical peptides and
  - fragments and is biologically possible, i.e. a potential

- 1 human blood-borne protein, is thus identified. It is possible
- 2 to identify plural targets in this fashion.

- 4 Following are exemplary, but non-limiting examples of
- 5 preparatory protocols useful in the process of the instant
- 6 invention.

7

- 8 Preparatory Protocols:
- 9 Any of these protocols may be selected from a column
- 10 flow-through stream, a column elution stream, or a column
- 11 scrub stream.
- 12 Hi Q is a strong anion exchanger made of methyl acrylate
- 13 co-polymer with the functional group:  $-N^+(CH_3)_2$ ;
- 14 Hi S is a strong cation exchanger made of methyl acrylate
- 15 co-polymer with the functional group:  $-SO_3^-$ ;
- 16 DEAE is diethylaminoethyl which is a weak cation exchanger
- 17 made of methyl acrylate co-polymer with the functional group
- 18  $-N^+(C_2H_5)_2$ ;
- 19 PS is phenyl sepharose;
- 20 BS is butyl sepharose.
- Note that the supports, i.e. methyl acrylate and
- 22 sepharose are different, but non-limiting examples, as the
- 23 same functional group on different supports will function,

  - MOPS of various molarities, pH's, NaCl content, PIPES of
  - 17 various molarities, pH's, NaCl content, Lactic acid of
  - 18 various molarities, pH's, NaCl content, Phosphate of
  - 19 various molarities, pH's, NaCl content, Tricine of various
  - 20 molarities, pH's, NaCl content.
  - 21 Following tryptic digestion, additional processing
  - 22 may be carried out, for example:
  - 23 Utilizing a type of micro-chromatographic column called a

- 1 C18- ZIPTIP available from the Millipore company, the
- 2 following preparatory steps were conducted.
- 3 1. Dilute sera in sample buffer
- 4 2. Aspirate and dispense ZIPTIP in 50% Acetonitrile
- 5 3. Aspirate and dispense ZIPTIP in Equilibration solution
- 6 4. Aspirate and dispense in serum sample
- 7 5. Aspirate and dispense ZIPTIP in Wash solution
- 8 6. Aspirate and dispense ZIPTIP in Elution Solution
- 9 Illustrative of the various buffering compositions
- 0 10 useful in the present invention are:
  - 11 Sample Buffers (various low pH's): Hydrochloric acid
  - 12 (HCl), Formic acid, Trifluoroacetic acid (TFA),
  - 13 Equilibration Buffers (various low pH's): HCl, Formic
  - 14 acid, TFA;
  - Wash Buffers (various low pH's): HCl, Formic acid, TFA;
  - 16 Elution Solutions (various low pH's and % Solvents):
  - 17 HCl, Formic acid, TFA;
  - 18 Solvents: Ethanol, Methanol, Acetonitrile.
  - 19 Spotting was then performed, for example upon a Gold Chip
  - in the following manner:
  - 21 1. Spot 2 ul of sample onto each spot
  - 22 2. Let sample partially dry
  - 23 As a result of these procedures, the disease specific

6 Fig. 1, Band 2) related to Alzheimers disease were found.

Figure 1 is a photograph of a gel which is indicative of the presence/absence of the marker in disease vs. control and, in cases where the marker is always present, the relative strength, e.g. the up or down regulation of the marker relative to categorization of disease state is

A method for evidencing and categorizing at least one disease state is disclosed. The steps taken include obtaining a sample from a patient, preferably human, and conducting MS analysis on the sample. As a result, at least one biopolymer marker sequence or analyte thereof isolated from the sample which undergoes evidencing and categorizing and is compared to the biopolymer marker sequence as disclosed in the present invention. The step of evidencing and categorizing is particularly directed to biopolymer markers or analytes thereof linked to at least one risk of disease development of the patient or related to

1 the existence of a particular disease state.

2 In addition, various kits are contemplated for use by 3 present invention. One such kit provides for determining the presence of the disease specific biopolymer 5 At least one biochemical material is incorporated 6 which is capable of specifically binding with a biomolecule 7 which includes at least the disease specific biopolymer 8 marker or analyte thereof, and a means for determining 9 binding between the biochemical material and the 10 biomolecule. The biochemical material for any of the 11 contemplated kits, by way of example an antibody or at least 12 one monoclonal antibody specific therefore, or biomolecule 13 may be immobilized on a solid support and include at least 14 one labeled biochemical material which is preferably an antibody. The sample utilized for any of the kits may be a 15 16 fractionated or unfractionated body fluid or a tissue 17 sample. Non-limiting examples of such fluids are blood, 18 blood products, urine, saliva, cerebrospinal fluid, and 19 lymph.

20 Further contemplated is a kit for diagnosing,

21 determining risk-assessment, and identifying therapeutic

22 avenues related to a disease state. This kit includes at

23 least one biochemical material which is capable of

- 1 specifically binding with a biomolecule which includes at
- 2 least one biopolymer marker including the sequence of the
- 3 particular disease specific biopolymer marker or an
- 4 analyte thereof related to the disease state. Also
- 5 included is a means for determining binding between the
- 6 biochemical material and the biomolecule, whereby at least
- 7 one analysis to determine a presence of a marker, analyte
- 8 thereof, or a biochemical material specific thereto, is
- 9 carried out on a sample. As previously described,
- 10 analysis may be carried out on a single sample or multiple
- 11 samples.
- 12 In accordance with various stated objectives of the
- 13 invention, the skilled artisan, in possession of the
- 14 specific disease specific marker as instantly disclosed,
- would readily carry out known techniques in order to raise
- 16 purified biochemical materials, e.g. monoclonal and/or
- 17 polyclonal antibodies, which are useful in the production of
- 18 methods and devices useful as point-of-care rapid assay
- 19 diagnostic or risk assessment devices as are known in the
- 20 art.
- 21 The specific disease markers which are analyzed
- 22 according to the method of the invention are released into
- 23 the circulation and may be present in the blood or in any

- 1 blood product, for example plasma, serum, cytolyzed blood,
- 2 e.g. by treatment with hypotonic buffer or detergents and
- 3 dilutions and preparations thereof, and other body fluids,
- 4 e.g. CSF, saliva, urine, lymph, and the like. The
- 5 presence of each marker is determined using antibodies
- 6 specific for each of the markers and detecting specific
- 7 binding of each antibody to its respective marker. Any
- 8 suitable direct or indirect assay method may be used to
- 9 determine the level of each of the specific markers
- $\bigcirc$  10 measured according to the invention. The assays may be
  - 11 competitive assays, sandwich assays, and the label may be
  - selected from the group of well-known labels such as
  - 13 radioimmunoassay, fluorescent or chemiluminescence
  - immunoassay, or immunoPCR technology. Extensive discussion
  - of the known immunoassay techniques is not required here
  - since these are known to those of skilled in the art. See
  - 17 Takahashi et al. (Clin Chem 1999;45(8):1307) for a
  - detailed example of an assay.
  - 19 A monoclonal antibody specific against the disease
  - 20 marker sequence isolated by the present invention may be
  - 21 produced, for example, by the polyethylene glycol (PEG)
  - 22 mediated cell fusion method, in a manner well-known in the
  - 23 art.

1 Traditionally, monoclonal antibodies have been made 2 according to fundamental principles laid down by Kohler 3 and Milstein. Mice are immunized with antigens, with or 4 without, adjuvants. The splenocytes are harvested from 5 the spleen for fusion with immortalized hybridoma 6 These are seeded into microtiter plates where 7 they can secrete antibodies into the supernatant that is 8 used for cell culture. To select from the hybridomas that 9 have been plated for the ones that produce antibodies of 10 interest, the hybridoma supernatants are usually tested 11 for antibody binding to antigens in an ELISA (enzyme 12 linked immunosorbent assay) assay. The idea is that the 13 wells that contain the hybridoma of interest will contain antibodies that will bind most avidly to the test antigen, 15 usually the immunizing antigen. These wells are then 16 subcloned in limiting dilution fashion to produce 17 monoclonal hybridomas. The selection for the clones of 18 interest is repeated using an ELISA assay to test for 19 antibody binding. Therefore, the principle that has been 20 propagated is that in the production of monoclonal 21 antibodies the hybridomas that produce the most avidly 22 binding antibodies are the ones that are selected from 23 among all the hybridomas that were initially produced.

- That is to say, the preferred antibody is the one with highest affinity for the antigen of interest.
- 3 There have been many modifications of this procedure
- 4 such as using whole cells for immunization. In this
- 5 method, instead of using purified antigens, entire cells
- 6 are used for immunization. Another modification is the
- 7 use of cellular ELISA for screening. In this method
- 8 instead of using purified antigens as the target in the
- 9 ELISA, fixed cells are used. In addition to ELISA tests,
- 10 complement mediated cytotoxicity assays have also been
- ll used in the screening process. However, antibody-binding
- 12 assays were used in conjunction with cytotoxicity tests.
- 13 Thus, despite many modifications, the process of producing
- 14 monoclonal antibodies relies on antibody binding to the
- 15 test antigen as an endpoint.
- 16 The purified monoclonal antibody is utilized for
- immunochemical studies.
- 18 Polyclonal antibody production and purification
- 19 utilizing one or more animal hosts in a manner well-known
- in the art can be performed by a skilled artisan.
- 21 Another objective of the present invention is to
- 22 provide reagents for use in diagnostic assays for the
- 23 detection of the particularly isolated disease specific

23

1 marker sequences of the present invention.

2 In one mode of this embodiment, the marker sequences 3 of the present invention may be used as antigens in 4 immunoassays for the detection of those individuals 5 suffering from the disease known to be evidenced by said 6 marker sequence. Such assays may include but are not 7 limited to: radioimmunoassay, enzyme-linked immunosorbent 8 assay (ELISA), "sandwich" assays, precipitin reactions, 9 gel diffusion immunodiffusion assay, agglutination assay, **10** fluorescent immunoassays, protein A or G immunoassays and 11 immunoelectrophoresis assays. 12 According to the present invention, monoclonal or polyclonal antibodies produced against the disease 13 14 specific marker sequence of the instant invention are 15 useful in an immunoassay on samples of blood or blood products such as serum, plasma or the like, cerebrospinal 17 fluid or other body fluid, e.g. saliva, urine, lymph, and 18 the like, to diagnose patients with the characteristic 19 disease state linked to said marker sequence. The 20 antibodies can be used in any type of immunoassay. 21 includes both the two-site sandwich assay and the single

site immunoassay of the non-competitive type, as well as

in traditional competitive binding assays.

- 1 Particularly preferred, for ease and simplicity of 2 detection, and its quantitative nature, is the sandwich or 3 double antibody assay of which a number of variations exist, all of which are contemplated by the present 5 For example, in a typical sandwich assay, unlabeled antibody is immobilized on a solid phase, e.g. 6 7 microtiter plate, and the sample to be tested is added. After a certain period of incubation to allow formation of 8 9 an antibody-antigen complex, a second antibody, labeled 10 with a reporter molecule capable of inducing a detectable 11 signal, is added and incubation is continued to allow 12 sufficient time for binding with the antigen at a 13 different site, resulting with a formation of a complex of 14 antibody-antigen-labeled antibody. The presence of the 15 antigen is determined by observation of a signal which may 16 be quantitated by comparison with control samples
  - 18 Antibodies may also be utilized against the disease 19 specific markers, as haptens, to create an antibody 20 response against the protein to which it binds, thereby identifying targets for treatment of the disease or a sub-21 22 class thereof.

containing known amounts of antigen.

23 Lastly, the markers and associated antibodies provide The second control of the second control of

- 1 a tool for monitoring the progress of a patient during a
- 2 therapeutic treatment, so as to determine the usefulness
- 3 of a novel therapeutic agent.
- 4 All patents and publications mentioned in this
- specification are indicative of the levels of those
- 6 skilled in the art to which the invention pertains. All
- 7 patents and publications are herein incorporated by
- 8 reference to the same extent as if each individual
- 9 publication was specifically and individually indicated to
- - It is to be understood that while a certain form of
  - 12 the invention is illustrated, it is not to be limited to
  - 13 the specific form or arrangement herein described and
  - 14 shown. It will be apparent to those skilled in the art
  - 15 that various changes may be made without departing from
  - 16 the scope of the invention and the invention is not to be
  - 17 considered limited to what is shown and described in the
  - 18 specification and drawings/figures.
  - 19 One skilled in the art will readily appreciate that
  - 20 the present invention is well adapted to carry out the
  - 21 objectives and obtain the ends and advantages mentioned,
  - 22 as well as those inherent therein. The oligonucleotides,
  - 23 peptides, polypeptides, biologically related compounds,

1 methods, procedures and techniques described herein are 2 presently representative of the preferred embodiments, are 3 intended to be exemplary and are not intended as limitations on the scope. Changes therein and other uses 5 will occur to those skilled in the art which are 6 encompassed within the spirit of the invention and are 7 defined by the scope of the appended claims. Although the 8 invention has been described in connection with specific 9 preferred embodiments, it should be understood that the 10 invention as claimed should not be unduly limited to such 11 specific embodiments. Indeed, various modifications of the 12 described modes for carrying out the invention which are 13 obvious to those skilled in the art are intended to be

within the scope of the following claims.
